# Preserve Cerebrospinal Fluid Leukocytes for 72 hrs to Increase Disease Detection with <u>TransFix</u> /EDTA CSF Sample Storage Tubes

The presence of white blood cells in the cerebrospinal fluid (CSF) is indicative of many central nervous system (CNS) diseases. The detection of leukocyte subsets in CSF is of vital importance for the accurate diagnosis and treatment of such diseases. However, low cellularity and cell viability of leukocytes causes challenges when analysing CSF with flow cytometry. This means that samples must be analysed urgently (within 1 h) which is not always possible.

**TransFix/EDTA CSF Sample Storage Tubes** provides increased recovery of myeloid and lymphoid cells for up to 72 hours for analysis via flow cytometry, compared to untreated or RPMI-treated CSF samples.

Now available as *in vitro* diagnostic devices in Europe.

## **Benefits of CSF Sample Stabilisation**

TransFix allows recovery of leukocytes subsets for up to 72 h days at 2-8°C, maintaining the immunophenotypic profile of CSF for better disease detection. This provides the following advantages:

#### Better for patients:

- More accurate diagnosis compared to untreated or RPMItreated CSF samples
- Reduction in the need for repeat lumbar puncture reduced trauma for patients

## Reduced cost:

- Provides the opportunity to transport the samples for centralised diagnosis and multicentre clinical studies
- Greater efficiency in testing allows for batching of samples prior to testing
- Further tests can be performed on the same sample after the initial analysis, without subject recall

### Convenience:

- Easy to use just transfer the CSF sample into the tube within 1 hour of lumbar puncture and mix by inversion
- Eliminates the need for weekend and evening work
- Reduces the impact of unexpected machine breakdown or staff shortages

## Widely endorsed by the clinical community

Recommended in the guidelines published in the British Journal of Haematology (1,2) Endorsed by:

- The European Society for Clinical Cell Analysis the Italian Society for Clinical Cell Analysis (3)
- The Spanish Lymphoma Group (4)

# <u>TransFix</u> /EDTA CSF Sample Storage Tubes provide a superior stabilisation method for CSF up to 72 hrs compared to other stabilisation methods

Mock CSF was stabilised with TransFix/EDTA, basal RPMI and complete RPMI and compared to untreated mock CSF (control). Figure 1 shows the recovery of lymphocyte subsets and monocytes at each time point. The event numbers for each cell subpopulation in the TransFix/EDTA-treated sample remained relatively consistent for at least 72 hours whereas the event numbers in all 3 other samples were low, particularly within the first hour. Cell events also decreased sharply in non-TransFix treated samples after 24 hours.

0 hrs

Control

Transfix/EDTA

Figure 1. Average (n=3) number of classified events for leukocyte subpopulations of the TransFix/EDTA stabilised sample (blue) compared to the untreated sample (light grey) and samples treated with RPMI basal (dark grey), RPMI complete (black) over 3 days.

The dot plots in **Figure 2** show side scatter vs CD45+ for the untreated control, complete RPMI and TransFix-treated samples at 0, 24 and 72 hours. The plots show that the density of events decreased with time in the control and RPMItreated samples. The density of the populations remained consistent for the TransFix treated sample and there was good separation of monocytes and lymphocyte populations

72 hrs

24 hrs

## **Product Format**

SSC

Product code	Description
TF-CSF-L-2	TransFix/EDTA CSF 1-4ml Sample Storage Tube (2 tubes)
TF-CSF-L-10	TransFix/EDTA CSF 1-4ml Sample Storage Tube (10 tubes)
TF-CSF-L-50	TransFix/EDTA CSF 1-4ml Sample Storage Tube (50 tubes)

#### Coming Soon - New format for smaller samples

**CD45** 

treated samples. Basal RPMI is not shown as it's comparable to the control.

Figure 2. Side scatter vs CD45+ dot plots for the untreated (control), RPMI Complete and TransFix/EDTA

Product code	Description
TF-CSF-S-2	TransFix/EDTA CSF 0.25-1ml Sample Storage Tube (2 tubes)
TF-CSF-S-10	TransFix/EDTA CSF 0.25-1ml Sample Storage Tube (10 tubes)
TF-CSF-S-50	TransFix/EDTA CSF 0.25-1ml Sample Storage Tube (50 tubes)
